Thread: [CSGO making a cheat source undetected](#)

Hf-botshop - July 23, 2017, 12:18 pm

I am quite decent at c++ and have put together myself a nice pasta and now I'm wondering what I need to do to make sure it's vac undetected (the dll and the injector)

I know I shouldn't c+p but hey ho I see people who never get backed do it all the time!

Any help is appreciated

Please note I posted here because I'm not allowed in any other area

Who cares gamers always want to stay clean
Play hard and be pro hacks won't last long
Valve updates coming soon !!

dump the vac module and look at what it's doing

You would have a better response on UC

<https://www.unknowncheats.me/forum/counterstrike-global-offensive/>

There are many copy pastes that use C# and C++

If you can't explain it simply, you don't know it well enough. Learn how Vac works, know the difference between internal, external and semi external cheats. Understand how Vac detects cheats, learn the difference between Vac and untrusted bans.

cra0 writes a blog dedicated to csgo cheats, <http://dev.cra0kalo.com/>

You can't say that youre decent with c++ and then say that you CP it. Fucking redundant as fuck.
