Thread: [\[Free + Source\] IRIS - Instagram Robotic Interaction Software \[1.0\]](#)

glitchgxd - July 30, 2017, 7:22 pm

I made an IG account creation tool. Initially I was going to turn this into a whole automation utility, but I put a hold on the full project. Maybe sometime in the future there will be the full system. For now it just makes accounts.

Source: <https://github.com/Glitch-HF/Iris>

Download: https://github.com/Glitch-HF/Iris/blob/master/Iris_20170730_1.0.zip

Basically, leave everything blank if you want random accounts.

Proxies are optional, you can use IP:Port, if port isn't set it defaults to 80. If proxy username is set, then it must have a password. Domain is optional.

Example of what it looks like:

Spoiler [\(Click to View\)](#)

If you have any feedback / questions, let me know!

If you are a C# developer and interested in this project, let me know.

If others want to see this out to completion, we can turn it into a project (and maybe even add other SMNs like FB/Twitter/etc). Github is already set up, but I haven't branched out yet until it goes into further development.

Excellent work Glitch! I'm sure other users will love this :)

covet - July 30, 2017, 7:57 pm

looks really interesting, thanks for this release, ill be sure to look about this, it has amazing potential.

Thanks! Take it for a spin, mess with the source (not sure how familiar you are in C#). I tried to design it in a way to allow for easy expansion. The ultimate goal to is for it to become an AIO Social Media Controller. I would love to have more people to help contribute to the project.

JAX010800 - July 31, 2017, 1:28 am

Thanks for the drop works mint! Maybe adding in a feature that allows you to output the accounts

into a account list or even allow users to mass follow a account with the created accounts. :D

That's the idea in the future! Like I said, I wanted to make this an all-inclusive bot to allow performing of mass-actions such as that. Follows/likes/comments, etc. From either the whole army, or for a specific "net" of accounts, or even down to an individual basis.

Also, linking accounts to specific proxies they were registered with would help when spreading out the army of requests. Creating "smarter" usernames so they don't look as spammy, uploading pictures/liking&following randomly/changing statuses (maybe these get copied from other accounts on IG to maintain realism), and just a variety of human-like functions.

Then when you've ran the bot for a while, you could have a whole army of accounts under your control that all seem human-like and can boost stats really quickly.

Tweakers1995 - August 2, 2017, 2:08 am

heheh thanks i needed this

KapitanZvezda - August 5, 2017, 12:45 pm

Neat. Thanks, some people really need this. Although I wont use it, I still want to bump the thread and get it.

Gbulla - August 5, 2017, 12:49 pm

The name sounds so professional. I thought this thread was gonna be some expensive top-level silicon valley instagram AI tool.

onsomeshiz - August 5, 2017, 2:38 pm

Thanks for this, looks very nice!

Haha yea eventually I want to make it something like that. It'd be neat to get some extra .NET developers on the project, but we'll see. For now I'll just make updates when I feel like it and/or if people request it.

peej - August 6, 2017, 9:19 pm

Works very well, thank you so much for this! Very good work!
