Thread: [PHP - Seeking A Coder That Can Do This](#)

Demoralise - August 11, 2017, 12:57 am

Basically I need a PHP webpage that will do this:

- 1) Load a webpage link inside an iframe embedded into the PHP webpage
- 2) Write any URL's that iframe redirects to into a blank text file on my server if the URL contains a certain phrase
- 3) Be able to access the captured link since it has been written to the text file using `file_put_contents`

My budget is \$60 USD worth of BTC though I am willing to negotiate.

This is not doable via php alone, since php will have no idea of the iframe content (php runs pre-view to generate a static view and iframe renders in static view). Hit me up with details on what you are trying to achieve and i might suggest a better approach.

JavaScript for the other part of the task, sending background request to a php script.

Send me a pm OP, I think I'm able to do this.

Vana - August 11, 2017, 2:07 am

I'd be impressed if someone pulls this off as you can't access an iframe to pull attributes like its URL if the content is from another domain.

Additionally, if the target website has an X-Frame-Options header set (most large sites do) you won't even be able to load it in an iframe.

Send me a pm OP, I think I'm able to do this.PM sent. If you can do this then you're a legend.

Inspire™ - *August 11, 2017, 4:05 am*

Send me a PM.

I reckon curl, would work better you could follow the redirects and log the redirects to the file i will mock up a script now.

Just tested it my idea works, have a fully working script with check if the url is in the string.
