Thread: [2FA doesnt work on tablet?](#)

Truth - August 15, 2017, 2:17 pm

My 2FA code doesnt work on tablet, It probably doesnt work on my desktop too but im not sure as I never needed to use it since I normally only use HF on my desktop and I am always logged in. I am thinking its because I am still using the official google app and not authy. If I reset my 2FA via

<https://hackforums.net/gauth.php>

Will it log me out? and ask me to confirm 2FA?

I am afraid if it ask for 2FA it will end up just like my tablet and not allow me to log in.

What should I do?

Thanks ?

Just hit "RESET CODE" and it will disable 2FA on your account. From there you can set it up again and make sure it's working properly.

Edit: Read the thread a bit too quickly, you can just input your code there and it will tell you if it works or not. Won't log you out or anything, it'll either say the code is valid or won't work. If it's valid then you're fine and if not then follow my instructions above.

Edit 2: No, it isn't because you're using the Google app instead of Authy. I've been using the official Google app since 2015 for HF 2FA (side note to anyone else who does this... make sure you back up your key!) since my GS3 doesn't like Authy for some reason.

your time is prolly not in sync
try fixing that

Okay, thats good to know it won't log you out if you input the code to test if it works or not. But does it log you out when you hit "RESET CODE"?

No, it doesn't log you out.

This. Nothing on that page will fuck you up so long as you don't hit the "log out" button or somehow get logged out through your browser.

I connected my 2FA device to wifi and it works now.

Its strange how if your device is offline it doesnt work but it still displays the code, Google should have a warning telling you to connect to wifi or something

Thanks :)
