Thread: [Cryptix : Firewall System](#)

**CryptixHacking** - August 16, 2017, 8:01 pm

This is a updated version of my older tool here,

<https://hackforums.net/showthread.php?tid=5670742>

This is a simple project I created that allows system administrators and PC users to see and check if any programs on there system are accessing the internet.

It then allows the users to select to allow to program to continue running allowing it to continue connecting to the internet, Or block it and force closing the application and opening its folder location on the system.

This program is simply a means to quickly check and see what programs on your system are making a active internet connection. It wont conflict with any other current running firewall programs.

This is a wise program to have running at times just to make sure no unwanted programs on your system are posting or getting data from the internet.

Maybe even a trojan/keylogger/bot has slipped past your own firewall and you dont know of it this program can help you to detect that.

When you block a file from connecting to internet it force closes the program then opens its folder location to find. Making it easy to find the location of files that you may not want connecting to the internet. There is also a included connection log viewer allowing you to see exactly what ports and IP's the program is using and connecting too.

### [Virus Scan Results](#)

DOWNLOAD REMOVED UNTIL MY REP IS FIXED  
Positive rep me for download
