Thread: [Can anyone tell me how to change/ spoof my mac address?](#)

Vladalice - August 19, 2017, 3:40 pm

I have followed semi-recent guides and none of them seem to work. I need this so i can access some game servers i was previously kicked off of due to the ban of my mac address. Any pointers are much appreciated. I am on a lenovo y-50 laptop with windows 10. Using a router for my internet.

Scy7e - August 20, 2017, 11:23 am

If they wanted you to come back, they wouldn't have banned you. Learn the lesson and move on.

If i still remember from this years college:

Open up powershell as administrator and type:

Code Set-NetAdapter -Name "YourEthernetAdapternamehere -MacAddress "Newmacaddress"

It will always reset to default if you restart tho.

His question was way too vague to give any kind of technical answer. We don't even know which device he's talking about. His modem? Motherboard's integrated NIC? A wifi adapter?

Assuming it's the MB NIC, we still don't know his OS or the version of the OS. He also stated he has tried several guides of which none worked. Why not? It's not rocket science, it's a less-than-a-minute job so I don't see how he could fail at that. He should've said what he tried to do, why or how it didn't work and then we could've helped him.

<http://lizardsystems.com/change-mac-address>

this may work

lwrist - August 20, 2017, 1:10 pm

I mainly work with kali.

>ifconfig eth0 down

>macchanger -a

>ifconfig eth0 up

On a windows box a program called "SMac Pro" will allow you to spoof your mac.

Then why post this? If I had seen this post before I'd report for being LQ. You should know better. It's frustrating to read responses like this...why bother posting?

@OP keep us updated if you figure it out. I am unsure how to do so, but I will update this post if I figure anything new out.

@Scy7e is the only one here who gave a helpful answer. No one of you said what is obvious:

Spoofing a MAC address is not the solution here. Not the MAC address is banned. The server isn't able to get the MAC address. The server can blacklist IP addresses, the server can recognize cookies, the server can use browser fingerprinting.

Forget about the MAC address. A Router can blacklist MAC addresses but ...
