Thread: [Good Forensic Recovery/SD Card Recovery Software](#)

Doggers - August 22, 2017, 12:35 pm

Hey guys,

Recently one of my friends SD card got erased, and I was wondering if there is any good forensic recovery or just SD card recovery software you recommend?

I know that there are some very good ones on the market, and due to the fact that I personally haven't used one in a few years I want to get some input.

Thank you :)

Back in the days I downloaded just about every program I could find to recover data on an SD card. All failed.

The thing was still readable (I could easily place new files if I wanted to, but this would maybe overwrite or corrupt the files I was trying to recover.).

And nothing was overwritten yet.

But still, nothing worked. Couldn't find anything.

For HDD I had some great successes though, and I can pretty much always recover everything. Even if it been overwritten several times.

But SD cards is a completely different story. And in general for most people are a huge pain.

There are companies that can recover it for you, but they charge truckloads of \$\$\$\$. In general to much for what the data is worth.

Honestly a data recovery specialist is the only way to really have any hopes of getting the data back. Had to do this for a clients wedding once. Almost shit my pants when one of my cards came up unreadable. Ever since then I write the data two both of the cards in my camera.

Yeah it's my friends friend gopro memory card...honestly I might just try one of the recommended ones from google, and let you guys know how it goes unless someone throws a specific suggestion :) - keeping this updated.
