Thread: [Linux command shortcut \[linux\]](#)

Mr. Noodle™ - September 16, 2017, 7:38 am

so im looking for a way i can add a shortcut to my home screen (desktop) and when clicked it will open terminal and run a command as im not good at remembering some of them.

Example: i sometimes run 'nmcli d wifi' that shows current wifis and signals. i was wondering if theres a way that i can just double click a shortcut on the desktop and it runs that for me ??

thanks aha, this could be simple but i personally dont know of it

genu - September 16, 2017, 3:02 pm

Code `#!/bin/bash`

`nmcli d wifi`

Save this and run it using

Code bash filename

You could also add an alias by editing (`~/.bashrc`), for example:

Code `alias wifi='nmcli d wifi'`

and then just type "wifi" on the terminal.

cant seem to get this one working, i opened and edit the bashrc in nano and save it, when i try to run (called with wifian as wifi is already taken by tlc) it doesnt work, just returns and error. anyways i got the bash file working great
