Thread: [Headphone sounds are weird. Some sounds are perfect others are extremely quiet & robo](#)

Chad ThunderCock - September 17, 2017, 6:01 am

It's hard to explain but for example some sounds are 100% normal and clear while other type of sounds are extremely quiet and kind of robotic, it's hard to explain but when listening to music there's several sounds going on at the same time and for example the background music can be perfect while the singer's voice can be extremely quiet.

Same for discord, discord itself is perfect but when someone speaks it's extremely quiet and robotic.

Left and right channel are working perfect central channel seems to be the quiet one how can I fix this

Evanescence - September 17, 2017, 6:06 am

Which headphones are you using?

Kaiba Corp - September 17, 2017, 6:06 am

Can you give us specs?

Some are designed for a specific purpose and that may be it, once I used "calling headset" to listen to music and got the same problem, since that particular model was meant mainly to use for phonecalls.

However if some higher end tech/brand I'm fairly certain you could fix this through the settings of the audioboard/card or even the HS UserControl (if it has one).

Hyper X Cloud 2 worked flawlessly for the past 2 years.

Noticed that if I crank out the jack a little bit the sound is perfect but it's impossible to keep it that way or it'll fall out, once I pull the jack back in the sound becomes kinda bass again / extremely quiet as if it was far away

Is there another audio output that you could connect the headphones to and see if that helps?
