Thread: [keylogger doesn't install](#)

samsuralom - September 17, 2017, 10:50 pm

Hi friends, I created a keylogger server of ardamax for remote installation. After that I crypted it using Stealth which I don't know if it worked properly, although the exe file was created. However while testing it on my VM system which has Windows 7 64 bit installed, it did not install saying it cannot install in 64 bit system. I am unable to understand what went wrong as the setup of Ardamax is installed on a Win 10 64 bit system? Please help me.?

HawkEyeXXX - September 19, 2017, 12:52 am

There are tons of reasons behind this. As far as I know your file was corrupted by your crypter. Please check unencrypted server on VM first.

samsuralom - September 19, 2017, 3:50 am

Hi @HawkEyeXXX, thanks for the suggestion. I followed your advice and the unencrypted server was easily installed in the vm system. When I unhid it in the settings it shows that the keylogger is logging. But the new issue that I am facing is that I am not getting the delivery to my ftp in html format although the logs of my host where the main setup had been installed, are getting delivered without any hindrance! The logs get delivered in .001 .002 .005 formats which are not readable by my log viewer! Please help me resolve it.

Ardamax crack is crap .. you need another keylogger

Dofeus - September 21, 2017, 1:30 am

I've used Ardamax but not crypting it. Maybe your file has been corrupted while crypting it.

I did not crypt it. I tried it on two different systems. The system where the crack has been installed sends the logs in HTML format to my ftp. But the system where I installed the remote engine created using Ardamax was installed (without any encryption), is not sending the logs to my ftp in HTML format. If I select the delivery mode as encrypted which can only be viewed using Log Viewer of Ardamax it sends .001, .002 and .005 files. But these are unreadable even after joining using HJsplitt or 7zip. I am baffled as to why it doesn't send the logs in HTML. Am I doing something wrong in the server creation?

HangMansheart - September 24, 2017, 9:50 pm

Hey man, I suggest grabbing a new crypter. Ardamax cracked won't cut it ;(
Good luck tho, OP

I suggest ByteShield as a good crypter :)

I've worked with Kareem and their team before and I found the 2.0 version to be extremely helpful. They just released a 3.0 tho, so go take a look.

Can you suggest any good one mate?

azooz - *October 4, 2017, 3:44 am*

use another keylogger mate,this one is crap.
