Thread: [\[Solus\] Screen Tearing](#)

ctOS - September 21, 2017, 5:38 am

Hey, guys. I'm going for a very specific look for my PC, and Solus GNOME basically comes with the look right out of the box. But I'm dealing with screen tearing. A lot. So I was wondering if I'd be better off keeping the GNOME desktop with Compiz to fix the screen tearing, or re-roll on Budgie with Docker.

I'll assume here that you are using Intel graphics..

You could add this line in your Xorg.conf file.

```
Option    "TearFree"    "true"
```

It goes inside the Devices section.

Example..

PHP Code

```
<?php
Section "Device"
    Identifier "Intel Graphics"
    Driver     "intel"
    Option     "TearFree"    "true"
EndSection
```

Section "Device"
    Identifier "Intel Graphics"
    Driver     "intel"
    Option     "TearFree"    "true"
EndSection
```

Intel HD 500 graphics. I'm reinstalling at the moment, I'll give this a shot when it's done.
