Thread: [How can I implement this?](#)

F.A.S.T - September 24, 2017, 11:01 am

How can I create a program that launches automatically when I plug in USB Drive?

Thanks.

Beladonis - September 24, 2017, 11:08 am

you want the program to be on the USB drive? You could use a badusb attack that download and execute a remote payload. Or execute a payload stored in the usb drive.

Faith Connors - September 24, 2017, 11:09 am

program that is already installed or program that launches remotely from usb or from script on usb?

already installed: program 1 hook all available usb-compliant ports on the computer. once any of them receives any data, launches program 2. or just have it running as a service or something.

second option: badusb. atmega32u4s seem to be a good option.

Yes, Execute a Payload stored in USB. But how do I get it to launch whence connected.

Didn't got anything except this. Looking on.

You can get yourself a Bad USB with micro SD support if you are willing to spend a few bucks on one, I heard good things about Malduino, it will do everything you need if you write the proper script for it. If you don't know anything about programming don't worry, there are many websites that generate you the script based on what you want it to do.

If you want to use a regular USB the only way would be using the autorun file, which only works up until Windows XP systems

There are tons of tutorials that teach this, did you google it?
