Thread: [DosCommand Component FREE!](#)

Xogg - September 29, 2017, 5:55 pm

DosCommand

Overview:

DOSCommand component let you execute a dos program (exe, com or batch file) and catch the output in order to put it in a memo or in a listbox, ... You can also send inputs. The cool thing of this component is that you do not need to wait the end of the program to get back the output. it comes line by line.

Why Get DosCommand?

ITS SO EASY TO USE, It makes working with batch 100000x easier and faster! Also allows to change current directory from property's and has easy to use events!

Helpful Snippets:

Set and execute a command

Code `DosCommand1.CommandLine := Edit1.Text;`

`DosCommand1.Execute;`

Set the current directory

Code `DosCommand1.CurrentDir := GetCurrentDir;`

Place output in memo

Code //this code needs to be in the "NewLine" event of the DosCommand

`Memo1.Lines.Add(ANewLine);`

Images!

Nice share.

A quick tip though: get a mega.nz account or something and use that for sharing. Mediafire links tend to die pretty quick.

Also, your hyperlink is set on the "Here" part of the last line, it's not distinguishable from the rest of the sentence as it is the same color. Not that big of a problem but some people will assume they can just click the whole sentence and it will download, rather than just the here, they might stop trying as they would think the link is edited out.

mega was just an example :P use whatever you like.

Also, you can export links from mega already containing the encryption key, that way they don't need to enter it :D

This is a nice component I personally have it installed, and use it quite frequently for "Batch" related tasks.
