Thread: [How to spoof emails?](#)

Chloe Price - October 1, 2017, 5:48 am

Hey. i want to learn how to spoof a email.

So.. is there any tutorials or anything?

I want to be able to send something like, "Chloe@gmail.com" instead of "Chloe_234434@gmail.com"

Thanks.

<https://emkei.cz/> works well but email is going to go to spam folder instead of inbox or shit like that.

I believe if you send it to an Hotmail/Outlook email inbox it will still appear out of the spam region. but I haven't tested it in 2 Months.

I tested it with gmail & protonmail and it went to spam both times.

Not sure about hotmail, yahoo and others.

Most likely big email providers check for valid DKIM/SPF entries etc.

OP, you could also send email using PHPMailer but that's if you are good with web development. It's easier to use the spoofers listed.

My message was sent to an Outlook email, and it got in the normal inbox, not the spam folder.

That site works by using the php mail function built into php and then uses custom headers within the mail function of the php not hard to do at all, Just requires you do a little header editing.

Example

Code <?php

```
$email = 'your_friend@hotmail.com';
```

```
$subject = 'We need your help';
```

```
$body = 'Hello, my name is Obama, and I need you to meet me at the whitehouse';
```

```
$headers = array(
```

```
    'From: Barrack Obama <barrack.obama@whitehouse.gov>',
```

```
    'X-Mailer: PHP/' . phpversion()
```

```
);
```

```
mail($email, $subject, $body, implode("\n", $headers));
```

```
?>
```

Then to have the mail not go into spam folder it usually helps to add the domain that the php is hosted on to googles domain manager and verify its domain with your google account. If you link your domain the php is hosted on to your google account this usually will be enough to stop mail going into spam folders.
