Thread: [Visual Basic Advanced Webbrowser Detailed Tut](#)

ryanwan1 - July 28, 2010, 1:26 pm

Hi, Welcome To Ma Second Tutorial On VB

This Time I'll Be Showing You How To Make An Advanced Webbrowser

(there have been hundreds of browser tuts but i'm going to make a more detailed one)

Okay First Off Open A New Windows FormName It Browser Or Whatever

First Off Add A Tab Control

On Tab Pages Remove All Of The Pages

Dock The Tab Control To Whateva Yuu Wont

Now A Status Bar

In The Status Bar Add A Progress Bar And A Label

Now Add This Code :

```
Code Private Sub Loading(ByVal sender As Object, ByVal e As
```

```
Windows.Forms.WebBrowserProgressChangedEventArgs)
```

```
    ToolStripProgressBar1.Maximum = e.MaximumProgress
```

```
    ToolStripProgressBar1.Value = e.CurrentProgress
```

```
End Sub
```

And :

```
Code Private Sub Done(ByVal sender As Object, ByVal e As
```

```
Windows.Forms.WebBrowserDocumentCompletedEventArgs)
```

```
    TabControl1.SelectedTab.Text = CType(TabControl1.SelectedTab.Controls.Item(0),
```

```
WebBrowser).DocumentTitle
```

```
    ComboBox1.Text = CType(TabControl1.SelectedTab.Controls.Item(0),
```

```
WebBrowser).Url.ToString
```

```
End Sub
```

At The Very Top Of The Code Page Just After "public class web_browser"

add This Code :

```
Code Dim int As Integer = 0
```

Now Add A Menu Strip

Add A List Item Named "File"

Now In The File Menu Add "exit"

The Code For "exit" :

```
Code Me.Close [simple]
```

Now Add "Tabs" To The Menu Strip

Then Add "New Tab" And "Close Tab"

Code For New Tab :

```
Code Dim Browser As New WebBrowser
```

```

TabControl1.TabPages.Add("New Page")
TabControl1.SelectTab(int)
Browser.Name = "Web Browser"
Browser.Dock = DockStyle.Fill
TabControl1.SelectedTab.Controls.Add(Browser)
AddHandler Browser.ProgressChanged, AddressOf Loading
AddHandler Browser.DocumentCompleted, AddressOf Done
int = int + 1
CType(TabControl1.SelectedTab.Controls.Item(0), WebBrowser).GoHome()
Code For Close Tab :
Code If Not TabControl1.TabPages.Count = 1 Then
    TabControl1.TabPages.RemoveAt(TabControl1.SelectedIndex)
    TabControl1.SelectTab(TabControl1.TabPages.Count - 1)
    int = int - 1
Now Add 5 Buttons

```

Name Them "Back, Forward, Home, Stop, Refresh

Now For The Code

```

Back :
Code CType(TabControl1.SelectedTab.Controls.Item(0), WebBrowser).GoBack()
Forward :
Code CType(TabControl1.SelectedTab.Controls.Item(0), WebBrowser).GoForward()
Home :
Code CType(TabControl1.SelectedTab.Controls.Item(0), WebBrowser).GoHome()
Stop :
Code CType(TabControl1.SelectedTab.Controls.Item(0), WebBrowser).Stop()
Refresh :
Code CType(TabControl1.SelectedTab.Controls.Item(0), WebBrowser).Refresh()
And Your Done, You Can Style The Form As You Like#
[If I Missed Anything Please Let Me Know]

```

"OMG BRO I MADE A WEB BROWSER"

No.

You guys are mean...it's clearly a tutorial for beginners and he lost time typing it...

I don't see this negativity when someone copy paste a keylogger src and call it tutorial..

Good job ryan!!

Entrepreneur - July 28, 2010, 2:14 pm

It has been posted many times.

Its not really a advanced browser anyway, its a web browser control OMG.

Ah, that's what I was going to post.

OT : That's a nice tutorial for the beginners ?!

your the one who actually pays for a forum site :))

just huvto say laffed at

its a forum site cmon

im jsst dion ths to waste time

Camf ? - September 18, 2011, 3:00 am

Good post! Thanks I'm using this as a base for my browser ?
