Thread: [USB Drive No Space](#)

Imfao3zWin - October 8, 2017, 1:24 pm

My Flash drive have no space, hard idk. It's 24 gb, but there is no 1 byte. It's empty, fucked.. I don't know what I do to this happen. How can I fix it ? I can't repair it from Windows property and it don't showing in Linux.

Easy. Just format the flash drive.

I can't, there is no space, so Windows doesn't give me permission. I tried from 2 Windows computers.

Right now I can't, but it showing in the start with 0 bytes and blue line. In properties - 0 free space, 0 used space or something like this. When I try to repair it "Windows can't repair, not allowed" or something like this..

Shoe - October 8, 2017, 1:37 pm

Interesting. My recommendation would be to spin up a VM running Linux (Ubuntu is a personal favorite) and install gparted.

Code sudo apt install gpartedThen run

Code gparted

Have the flash drive connected to the host machine AND make sure that your VM is set to allow the flash drive as a removable device. Once in gparted, check the disks at right and select your flash drive. Format it entirely. Remember, this is a VM so feel free to break it entirely: make mistakes.

Go to Computer Management>Storage>Disk Management and see if you can delete the volume and then create a new one.
