Thread: [How to "transfer" a powerpoint installation?](#)

atrix25 - October 8, 2017, 2:45 pm

Hi everyone,

I have a work computer with special macros / toolbars installed in powerpoint and would like to "clone" this onto my personal computer.

Does anyone have interesting ideas on how to potentially do this? I was unable to find raw ways to install the macros and they seem deeply embedded into the registry etc.,

Is there a way to create a system image that could work, transferring onto another computer? Does anyone have interesting ideas?

You can try a app like this <http://pickmeapp.com>

Can't you find the download directory and transfer it via USB?

No. Registry values wouldn't be transferred.

OP, if you want a full system image, that's very easy. You can use the built in tools in Windows to do that if you want to.
