Thread: [IRC Net Spots/Partner](#)

Gomx1992 - October 9, 2017, 6:44 am

I've been creating telnets for quite a while, and I managed to setup an IRC yesterday for the second time.

I'm going to start selling spots on my IRC net. All the money I make from the spots will be contributed to the Botnet and to improve its power.

Do NOT ask for Admin.
Do NOT ask for Lifetime.

I charge monthly.

My Skype is: Booby.the.builder341

Add me on skype to buy a spot or if you are interested in partnering with me.
Looking to expand my knowledge, so please know what you're doing.

mrjammy - October 9, 2017, 11:23 am

This is not allowed on HF lmao

Hastur - October 9, 2017, 11:24 am

Booby.the.builder341
this has to be a troll lmao

>Creating "telnets"
>"Managed" to setup an IRC

By the looks of it, you know very little and clearly had trouble installing an IRC daemon, how depressing.

I suppose I've only been doing this for 2 weeks with no help and limited knowledge.
I don't understand why you're obsessed with me but... Find someone else thanks.

Twitich - October 11, 2017, 2:59 pm

You are a complete idiot just leave this forum

I mean, I'd love to bet that you have no knowledge of coding, and you simply run public nets with all your years of wasted knowledge opportunities. I don't want any disrespect if I'm not giving it to anyone on here first.

Is that why it's your 2nd time setting up an irc? I was using your same shit exploit in 2015 running bins on more than 50k devices Imfao

Tsukiri - October 12, 2017, 11:03 am

No offense, but it sounds like you're just trying to make money from a modded Mirai/QBOT source. Everyone has to start somewhere, but you have to understand that you cannot make money from a product like this after you've been just into it for 2 weeks. Again, not trying to offend you, but it just sounds like you have little knowledge of the stuff yourself (yet). I would suggest you actually learn how the telnet stuff works, maybe add stuff that will really improve it (maybe more routers etc, since

QBOT/Mirai which I assume you are using is pretty old by now). I thought there was something around

which could automatically patch the vulnerability after the device was loaded onto your botnet, I don't

think Mirai has that feature (I don't do IOT botnets). Maybe adding that would be a nice idea.

Just keep your head up and try to learn something. If you get a proper product of your own, you will have

a way better time making money in the future. Maybe try HTTP botnets instead of telnet stuff?

Aye thanks man, I'm always open to expanding my knowledge.

You're right, I suppose I was a little hasty trying to make money with limited knowledge. I was just trying to improve my net for myself and the users who bought a spot if any. I really appreciate you taking the time to help me out man! Although as for a HTTP Botnet, are there online tuts for that? Useful ones? Anyways thanks for the help man, everything has been taken into consideration and

will expand my knowledge before I try making money.

Just search around, there are zillions of HTTP botnet sources around. For example Gaudox, Betabot, stealers such as Pony and Loki... Go to github and check all the sources, the knowledge there is unlimited. Don't try to use them though, they are shitty and outdated. But some code is good and you can learn how it all works just by studying the code. Try to make your own net, you can copy paste good stuff and edit it to work together properly, and you will have a decent thing if you put your time into it.
