Thread: [Decompiled a scam JAR file](#)

Briceag - October 15, 2017, 6:21 am

Hello!

So i used a online service to decompile a scam JAR file i've got on my email :

Here's what's inside : <https://i.imgur.com/EQb3cWy.png>

All the files have the same short script: <https://i.imgur.com/IH7ZB3Y.jpg>

Any idea what this is?

The code is importing a custom module , something that may be developed by the malware creators called Folonej and using their own sub-modules so this makes it hard to decode what they are doing.

If this is a malware, could you please send me a copy I would really appreciate it.

Java isn't my speciality, but I'll see what I can do. Being completely honest, the reason I am asking a copy is more for myself because I like trying to understand what a malware does and how it does it by running on a VM. Just something I like, not a professional at this so don't expect a high success rate from my side.
