Thread: [HELP Darkomet dont connect local](#)

MarkusxX25 - October 20, 2017, 12:32 pm

hey, i have little issue with Darkomet and other Rats...

First :

1. Testing 3 Routers with different Networks
2. Open Port UDP and TCP on Router
3. Turn Off Firewall on Computer and Rules
4. Turn Off Anti Vir
5. Running Win10

Now i have setup darkcomet with 127.0.0.1 and localhost -> nothing cant connect myself

what is the next step to check?

ImSimplyNameless - October 20, 2017, 12:39 pm

From all RATs there are you choose to use Darkcomet?

MarkusxX25 - October 20, 2017, 12:44 pm

I have Plasma RAT too... i have use this for my settings for test localhost and this is not working

991z3r0 - October 20, 2017, 1:05 pm

.....why would you open ports on your router if it is local traffic you are connecting with?

If you actually are only connecting locally you would only have to turn off your firewall(or allow port through firewall) and disable or turn off any anti botnet or traffic blocking programs, some AV may cause issues.

Basically it sounds like you are trying to open your shit up to the internet, but that's just my view on your thread.

The correct grammar by the way is "does not"

MarkusxX25 - October 20, 2017, 1:30 pm

German :D

Okey i have turn all off AntiVir , Check Firewall Ports and Turn Off the Rules , Disable Defender . I try to connect local and this does not work for me . Then when this work local i can try with Internet Connections

FractumSeraph - October 20, 2017, 1:32 pm

Probably a NAT issue if I had to guess. Perhaps try using 127.0.0.1 instead of your dynamic host.

Anyways, you shouldn't be using DarkComet anyways. There's an exploit in it which lets anyone on the internet know when you're using it, [and be able to send you viruses](#).

It's hell a outdated anyways. Try [Quasar](#) instead.

Turn your antivirus back on. Enable defender. Enable firewall. NOW.

MarkusxX25 - October 20, 2017, 1:38 pm

Okey, i have removed all and scanned. i test Quasar !

Same issue i cant conect to Localhost :(127.0.0.1

FractumSeraph - October 20, 2017, 1:54 pm

Made a quick video of me doing it.

I agree with Fallen here, sounds like it could be a NAT issue.

However, on the note of Dark Comet.

CONsider the fact that a recruitment challenge to get in to Legends group is to literally HACK a Dark comet binary and reverse the connection to hack the controller.

<https://hackforums.net/showthread.php?tid=5665178>

You just MIGHT want to re-consider using that RAT.

The fact we run an active challenge to hack in to a Dark Comet Binary, and its proven to work. (3 members admitted already)

Should be a clear indication if users on HF here can do it, consider how at risk you are by using the software to begin with.

MarkusxX25 - October 21, 2017, 2:35 am

And how fix the NAT issue? Quasar is same issue with 127.0.0.1

No one idea? for this issue?
