Thread: [Why does my computer sleep after 60 seconds?](#)

Crypt - October 20, 2017, 1:01 pm

For some reason if I don't touch my mouse my computer will go to sleep after 60 seconds. However, I have it set to not turn off until 15 minutes have gone by and I set it so sleep "never" in the power & sleep menu.

I also have my energy usage set to "high performance" so it doesn't have anything to do with the configuration of my energy usage. What am I missing here?

<http://www.makeuseof.com/tag/fix-windows-10-sleep-mode/>

Give this a read, might fix your problems. Double check and make sure that your preferences are what you want them.

Give this a read, might fix your problems. Double check and make sure that your preferences are what you want them.

Read through all that and it didn't fix the problem.

So you checked the power settings in the advanced power options menu? What's the time set to?

Try a registry edit. Open up regedit and find for "785aacao" and change the attributes dword value to "2". Restart and test?

You need to go check control panel/advanced setting.
