Thread: [Apprehend Desktop Capture Component Cracked!](#)

Xogg - October 26, 2017, 7:05 pm

<http://www.frontiernet.net/~w2m/apprehend.html>

The Apprehend screen capture component for Embarcadero™ Delphi captures images of the desktop or full screen, a selected area of the screen, the active window, a selected object or window, a freehand (polygon) area of the screen, pre-selected icon sized (16x16, 32x32 or 48x48) area, and user specified area of the screen. Apprehend demos for TImage or ImageEN are provided. (See [Demos](#)).

Apprehend is a non-visual component that encapsulates the functionality of screen capture with functions to CaptureTheDesktop, SpeedCaptureDesktop, CaptureTheActiveWindow, CaptureSelectedObject, CaptureSelection, CaptureSmallIcon, CaptureIcon, CaptureLargeIcon, CaptureSpecificSizeSelection, and CapturePolygon.

Apprehend optionally minimizes the main form before capturing an image and optionally copies the image to the clipboard. Hints and Capture information are available as ShowHint and ShowInfoDialog options respectively. Apprehend returns a bitmap of the captured image. Using the component to capture images is simple, requiring only one line of code.

```
BMP.Assign(ASGScreenCapture1.CaptureDesktop);
```

Download Apprehend Desktop Capture [Here](#)

Stop giving people tools to make rats, you'll flood the market and ruin sales! :))

Joking, nice share.

This component is amazing if you want to be lazy and not code your own screen capture.
