Thread: [GPU Extremely Low Voltage](#)

blake012900 - October 31, 2017, 12:23 am

Well on HWMonitor i'm seeing 0.001v, and on HWInfo i see higher than 0.001v, extremely confusing me, any help is appreciated, even under heavy loads it stays at 0.001v on hwmonitor

Probably a bad reading....

I assume you have the monitor plugged into the 480 and not the motherboard?
Also, try checking while it's under load.

blake012900 - October 31, 2017, 12:30 am

Yep under load same thing but in hwinfo it's different readings.

Edit:

Can you rec a new mobo?, my current one only supports 95w but i need a 125w for my 8350, my budget is \$80, i'm stuck using a 95w for the past 4 months because of budget issues.

This is just weird, HWMonitors voltage isn't right?, hw info seems to be giving correct voltages guess i'll have to use hwinfo from now on.
