i will probably add one in the future.

a .net packer "wraps" ur .net file in a native file, so your main application is native.

darkcomet is old, and only works on windows 7 and below, also its detected in memory.

Im working on a method to bypass these memory issues.

but as said above darkcomet is old and outdated i do not suggest using it.

i bypassed kaspersky endpoint security with # 1.9.5:

well this is made with autoit, and it's clearly obvious that it is detected by Eset Firewall too...

btw just a tip for the coder of this, this crypter could support .net applications too...

just by changing the injection to a .net windows application (like "aspnetcompiler.exe" for example)

I got his tool, and it is an incredible crypter. FUD, and the execution speed is insane. It makes delivering the payload a super easy task as well. Very nice and supportive guy as well. Unlike many other crypters, this did not ask for weird dependencies and run-time errors. It immediately connected within less than 3 seconds. It supports persistent payloads too. Wonderful experience with this guy, 10/10 :)
