Thread: [Multiple type-in from textbox to database](#)

zetza - November 9, 2017, 10:36 am

Hey

Languages used will be:
JavaScript/Jquery
ReactJS
ASP.NET MVC
+ some

I'm looking for what this method is called, here's an image:

So basically the thing that's typed in, should add below when a user hits enter on pc and return on tablet/smartphone, and when the entire thing is saved, it should be assigned to a users' notes and be displayed.

This is how it's going to look in my web app:

And the values should be shown here to their corresponding task:

A name for the method, or a link for a tutorial or something would be a great help, thanks.

Method? I am confused by what you're asking because this isn't a "method", this is UI design by some custom code or framework.

I understand your confusion. I found a couple of examples of it:

<https://www.npmjs.com/package/react-select>

<http://itsolutionstuff.com/post/bootstrap-input-multiple-tags-example-using-tag-manager-jquery-plugin-example.html>

^-- This one being the closest to my question

Thanks for the clarification. They are called "tags" but essentially they are just a list/row of dynamic HTML elements with some text and a style associated with them. There's probably lots of packages (or whatever web developers call them) out there that will do this though.

I don't know what package is used in the screenshot though sorry.

Couldn't find anything before with the tag-search.

Do you know if there's a way to get these values into the sql database, since these are going to be shown on this part of the page?

If it's not your website you'll need some kind of parser. Then just look for the tags that match what you need to extract.
