Thread: [\[Free\] Simple Java Combo Maker \[Cross Platform\]*](#)

Sheeple - November 10, 2017, 1:55 pm

This will be by first ever program actually written entirely by me with 0 copy+paste I think.

Image:

Spoiler [\(Click to View\)](#)

"Features": Super sick browse directory window

Fast as I think, can put together a 5 GB file and 2 GB file(240 Million Lines~) together in a minute, and anything < 1 GB in a few seconds

Loading bar turns purple when done

Things that need to be done: Doll up the source code for efficiency and prettyness

Maybe a textArea to hold the file so you can see the contents

Fix loading bar idk how to make that load as the BufferedReader reads the file

Fix the horrendous GUI with a theme or something

Drag & Drop?

Custom delimiter (default :)

The ability to add multiple files and specify the order in which they come together
file4:file2:file3:file1 etc

Output drops to current directory as Output.txt, need that to be custom to it doesn't consistently overwrite

Testing new file types

Different platform testing only working on Win10 since that's what I have

Regardless if you like it or not, use it or download it, let me know if I should work on something fix something etc. I'm trying to get better <3

Download && Virustotal:
