Thread: [\[Release\] GUI Frame](#)

IllegalSkills - November 17, 2017, 6:42 pm

Code import javax.swing.*; // I import the necessary library to do this

```
public class IllegalSkills {  
    public static void main(String[] args)  
    {  
        JFrame frame = new JFrame("This is a test by IllegalSkills");  
        frame.setVisible(true);  
        frame.setSize(300,300);  
        frame.setDefaultCloseOperation(3);  
        frame.setResizable(false);  
    }  
}
```

Let me know if you guys have any problems or need help. <3

I feel like your thread lacks any details. Can't tell if this post is a troll

eSp0rt - November 18, 2017, 1:11 am

What is that seriously? What the point of this thread.

matt - November 18, 2017, 1:41 am

Nobody uses Code setDefaultCloseOperation(3) unless they know that JFrame.EXIT_ON_CLOSE is equivalent to 3, must be a troll.

Aussie - November 18, 2017, 5:22 pm

Curious, why would you also use Swing when JavaFX is gonna make it obsolete? :D

Are you implying it's fine to use a magic constant if you know what it refers to? I prefer not having to stop and try to remember what 3 means every time I'm reading through that code ???
