Thread: [How do I include quotes in a variable?](#)

Sir-Teabag - November 18, 2017, 7:45 pm

Hey!

I had this thing that basically makes a new page, right. But it uses Bootstrap and quotes are NEEDED inside it. Without quotes inside the variable it all works but the layout looks really really bad.

So how do I include quotation marks in the variable like this?

<http://net-paste.com/id/e679e696e.html>

Having "utf-8" without the quotes works but having it with them just ruins it, ya know?

Any help is really appreciated, as I'm still really new to PHP :)

You can either use single quotes or escape the double quotes with a single backslash before each: `charset=\"utf-8\"`

Thanks so much bro! I'll give this a shot when I upload it tonight. Really appreciate the reply!

This is called escaping. Check out the php doc for strings

<http://php.net/manual/en/language.types.string.php>

Does rewording and linking to the manual really do anything besides boost your post count?

Yes, it gives him insight on what it's called so he can do further research.

Enjoy the -4.
