Thread: [Image Insert not working!! PLEASE ASSIST](#)

rich1402 - November 20, 2017, 12:11 pm

ey all,

Before you think I'm a complete dumbass, I'm not...Let me tell you what I know/have tried:

- 1) I have over 50 posts...I can post links so not sure why the images are not working
- 2) I have tried [censored], Imgur and Posting websites to upload my image to and grab the link
- 3) I have tried Chrome, Firefox and Explorer...
- 4) I have added the direct link into the box after clicking on the "Insert image" icon in the post editor
- 5) I have also tried taking the forum link from the image site (with the code) and pasting it between the tags...
- 6) I have even tried adding it via the standard link icon...

It works in the editor but as soon as I click PREVIEW POST, or actually post it live...It just shows this -> [Image: image-link.png] and not the actual picture (or it shows the same text I just mentioned but with a small X icon in front of it, like it's a broken link)

I am pulling out my hair here...Any help much appreciated!!

Richy B - aka the "FlipFlop Dude"

I think I know what is going on, you are trying to post a remote picture from a non-secured(SSL) location such as http://... try using https://... and see if that works.

If that is not the case, can you show us the BBCode you are trying?

M?xim - November 20, 2017, 12:13 pm

Do your image host support HTTPS? [Imgur](#) for example does.

Code [img]https://i.imgur.com/ocoZGXE.jpg[/img]

Your code has to look like that. Note the https, not http.

So both of you are absolute legends!!! I was using a non SSL supported upload site...Used IMGUR as requested and worked perfectly.

Thanks so much guys. Really helped me out there!!
