Thread: [How to FUD with ByteCrypter](#)

pmatt - November 20, 2017, 2:40 pm

When I crypted my RAT with ByteCrypter and then scan it it says 0/38 dedected... thats good. But when I test it on my test pc my rat will bee dedected and deleted... why when it is FUD?

But I also got some slaves and they dont dedected it. I saw a guy do a full av scan and it doesnt dedected my RAT...

So what do I wrong...

When I build the RAT I unchecked all options like registry start or something. That is right, isnt it? Because the crypter should do that right?

Thanks for your help

Faith Connors - November 20, 2017, 2:58 pm

Scantime != Runtime

Thats really all to be said

pmatt - November 20, 2017, 3:09 pm

So I can nothing do? only hope that my slave dont dedect my RAT?

Can I scan runtime too?

Faith Connors - November 20, 2017, 3:11 pm

scanning runtime is just running the file in a sandbox to check detection.

pmatt - November 20, 2017, 3:33 pm

oh ok thank you very much!!

CyberStrike - November 20, 2017, 3:38 pm

I hope you are not uploading to virustotal either.. nodistribute

pmatt - November 20, 2017, 3:39 pm

No bytecrypter has a build in file scanner

Whats the best settings for FUD?
