Thread: [personal assistant help](#)

Duravex - November 29, 2017, 7:22 am

I want to build a text-controlled personal assistant with python for my computer. It should work offline and should be able to open other application of computer.

So how can i build my personal assistant?

Any tutorials please share it. Thanks in advance!

Break it down into it's major functionalities. Then tackle each functionality seperatly. Keep breaking it down until it makes sense. Do a google search for tutorials on each functionality. You're more likely to find a google result on "open program with python" than "tutorial on how to build a personal assistant that can open programs for me"

Some documentation that might come in handy for your project:

[Taking user input](#)

[Opening a new process in Windows](#)

Though, if that's the only functionality you're planning on, then using shortcuts or terminal aliases sounds like a better option

Basically what I was going to say. Go through one by one and keep improving on it. Youll get there soon, but take pride in it and learn while coding.
