Thread: [Invoking Button Click On Webpage causes stack overflow](#)

YourAverageTurk - December 1, 2017, 1:50 pm

Okay i have a winforms application and i am trying to automatically login with my details to paypal on the click of a button,

The correct email:pass is passed to the login form, But when the btnLogin is invoked it throws me a Stack Overflow error and the webpage doesn't load.

Here's my code:

```
Code Private Sub Button1_Click(sender As Object, e As EventArgs) Handles Button1.Click
    WebBrowser1.Document.GetElementById("login_email").SetAttribute("value", TextBox1.Text)
    WebBrowser1.Document.GetElementById("login_password").SetAttribute("value",
    TextBox2.Text)
```

```
    WebBrowser1.Document.GetElementById("btnLogin").InvokeMember("click")
End Sub
```

Any help is appreciated thanks ;)

EDIT: I don't believe it's my code as i tried just clicking the login button on the browser non-programatically and it didn't work either :(

Try setting the FEATURE_BROWSER_EMULATION registry key. More info on that here:

<https://blogs.msdn.microsoft.com/patricka/2015/01/12/controlling-webbrowser-control-compatibility/>

Didn't work either, I don't believe it's me or my PC, Possibly the site i'm trying to automate. Login works with google ect but not this site.

Sounds like a good solution, I'll have to check if they're compatible with 4.5.2 framework
