Thread: [VB.Net Write to Imported Access Database](#)

eXero - December 3, 2017, 1:15 pm

Hey y'all,

I am in a VB.Net class at university. I am trying to finish up an assignment where I have an access database with a table and some data within that table.

I have already imported the database into my VB.Net application and I can already sort through all the records and everything.

I am trying to figure out how I can enter information into my form and it write to the database as a new entry?

If you need more clarification, let me know. I need help figuring this out ASAP.

to show it you need to load it to listview for example

http://www.vb-helper.com/howto_net_load_listview_from_db.html

then you can save the listview to database or file

I'm not 100% sure what you want, but I think you mean this :

```
Code      DataClasses1DataContext db = new DataClasses1DataContext();
public MainWindow()
{
    InitializeComponent();
    // ga nu de comboboxvullen met gegevens uit de database
    ComboBoxEmployees.ItemsSource = db.employees;
    ComboBoxEmployees.DisplayMemberPath = "email";
}

private void button1_Click(object sender, RoutedEventArgs e)
{
    employee selectedemployee = (employee)ComboBoxEmployees.SelectedItem;
    label1.Content = selectedemployee.voornaam + " " + selectedemployee.achternaam;
    label2.Content = selectedemployee.telefoonnummer;
}
}
```
