Thread: [Can I use mobile hotspot to get passwords](#)

Cdai - December 12, 2017, 4:18 am

A lot of people are connected to my mobile hotspot, was wondering if there's a way I can get their passwords while they're using it.

Download Virtual Box and install Kali Linux on it.

Connect your PC to your hotspot, and run man in the middle attack. You will be able to sniff most of the passwords their using.

PS: you might need a network adapter that can spoof the address.

Well it can be done easily with nethunter. What phone you using?

Zanti might be a quick solution for this.

If you need help setting up nethunter lmk, i have done it quite a few times.

Don't think MIM attack will do much these days as most if not always, connections to web pages are all HTTPS, so you won't see much with MIM, at least with urlsnarf.

Don't know if there are better tools these days to show HTTPS with MIM...if there are please advise
