Thread: [Methods to take for SQL injection parameter finding](#)

mrrabbit64 - December 13, 2017, 2:34 am

I need help with trying to SQL inject a website.

Basically cryptomining.farm has gone a week without paying me, have closed all my support requests without answers. And continue to ignore my messages and calls.

Of course its pissing me right off because I've invested quite a bit of money in the hundreds for 13.5Th/s mining power

So far I've scanned there website, found no SQL injection parameters. But I've located the IP behind cloudflare and found there PHPMyadmin page. With a HTTP login.

Could someone please give me some steps or guide me in the right direction for gaining access to there database? I don't plan on taking it down or anything like that.

My main goal is to either somehow get a refund in BTC Same amount I paid or to add more mining power to compensate for the money I've lost

I've tried dozens and dozens of different programs on Kali but no success. Tried using Havij 1.18 Pro and no success

JustHackIt - December 13, 2017, 1:06 pm

Don't spend you time with Havij, try SQLmap.

Email me to chat
