Thread: [MySQL - Killed my MySQL?](#)

Skidy - December 15, 2017, 6:08 am

So, I added 10,000 results to my remote SQL server, and it just caused it to break. I reinstalled everything and it works but AS SOON as I enter the 10,000 records mySQL server crashes and I can't restart it.

the error:

Does anyone have any ideas?

This is my error log

Something to do with InnoDB: Cannot allocate memory for the buffer pool?

<https://stackoverflow.com/questions/25965638/mysql-fatal-error-cannot-allocate-memory-for-the-buffer-pool/32932601>

It would appear mySQL is out of memory? I have a 20GB ssd. How is this possible?

<http://www.webtrafficexchange.com/solved-mysql-crash-fatal-error-cannot-allocate-memory-buffer-pool>

Make sure you change 512M to 512K.

Fixed.

Memory = RAM

Storage = SSD

Storage = SSD Yeah at first I thought it was storage, then I realised it was RAM.

Your setup can't handle the size of the file you're uploading - break it up into smaller chunks (e.g. 2k records at a time) and try that way
