Thread: [Navigation menu cannot interact with tab page](#)

Dotexe - December 30, 2017, 2:50 pm

Hello, i'm using a bit weird theme where tabcontrol is not opening automatically each tab page, because there are 2 components, the first one is NavMenu where its basically to choose between for example dashboard or settings, and the second component is TabControl, its weird because on NavMenu i've got

Spoiler [\(Click to View\)](#)

where you can see Dashboard interact with tabPage1, but when i go on Settings, and select tabPage2 its not moving, its basically again staying only in tabPage1. How do i fix this ? ?

You should add your "tabcontrol" on that "navbarmenu" so you navbarmenu will know what tabcontrol he will control. ?

Not in that dialog. In NavManu property, where you can edit the Name, Tags, TabIndex, there should be a name where you place your TabControl.

Also tell us what NavMenu is it so we can check the property and what settings did you missed.

Are you making a RAT? That monitor icon looks familiar.
