Thread: [startxfce4 and startx both give me a black screen \(arch linux\)](#)

zombieman - January 8, 2018, 2:12 pm

Basically what the title says. I installed arch linux to dual boot alongside windows 10 64-bit UEFI, and it's been going smoothly up to getting X/XFCE4 to work.

Here's the Xorg.0.log log file if anyone could help me out.

<https://ptpb.pw/ocCS>

Thanks!

Did you install your graphic drivers?

Most likely going to have to install the non free drivers.

I have nvidia drivers installed (I'm using a laptop). I heard somewhere that I need to install bumblebee too?

I believe bumblebee just deals with power management with switching between the card and onboard graphics.

Bumblebee and installing intel drivers did the trick, XFCE is up and running.
