Thread: [CLONE ICONS, MANIFEST, RESOURCES, CERTIFICATE using C# with NO THIRD PARTY LIBRARIES!](#)

gigajew - January 14, 2018, 11:04 pm

I've been working on this class lately that allows you to "clone" resources like icon, version and manifest data from one executable to another, without using third-party tools or libraries such as Resource Hacker. And today I'm happy to announce that after a lot of research and troubleshooting, I got an early version working. The API is not very clear on this one, so there was a lot of trial and error involved, along with a lot of Google searches. But here it is! My hope is that somebody takes this code, cleans it and implements it in a better way than I can. And perhaps translates it to Visual Basic .NET. I think the existence of this class has been long overdue. Note that the code does have some errors, it's not perfect but it gets the job done. Consider this the first step in the right direction towards crypter cloning features. I'm not held responsible for how you use this information.

A bonus I decided to throw in is a certificate cloner. I hope ya'll enjoy.

Here's the example code with the signature cloner feature:

It needs to be fixed before translated, but good effort, also don't post it in this thread, it takes too much feedback space up. Make your own thread in the proper section

Pretty sure some of that code can be re-used, but other than that it seems good. Thanks for contributing man. 8^)
