Thread: [local file inclusion question](#)

DarkWapOne - January 19, 2018, 2:24 am

hi there

how can i get a shell uploaded on a website without accessing the proc/self/envron file because every time i change the the path to it i either get an error message or a blank page what should i do to upload a shell to the site

[BLANK] - January 19, 2018, 12:48 pm

If you uploaded a php shell to the server through LFI/RFI then seeing a blank white page can mean it is working. Maybe there are other factors at play. The code is wrong? Your reverse connection is not set up correctly etc. We would need a lot more details to help, also we won't help if what you are testing is illegal.

the problem isn't with the shell, its within the proc/self/envron file that i can't access, it gives me a blank page when i try to display the content of it
is there any other way to upload a shell without this file

Baud - January 20, 2018, 11:21 pm

Well yes that's a pretty outdated method, it's no surprise it doesn't work. Uploading a shell with LFI relies on injecting malicious code on a vulnerable file and then loading that file to get the shell. There are a few other ways to do it, these are the ones I know assuming we're talking about a Linux machine:

- mail server logs injection: /var/mail/valid_user (you might need some enumeration work to find a valid username)
- SSH logs injection: /var/log/auth.log
- Apache logs injection: /var/log/apache2/access.log

Try loading either of those files, if they load, they could be vulnerable and you can inject malicious code in them. Try them all and post here if you find them.

You look like a scammer judging from your other posts.

hi_man - *January 23, 2018, 3:04 am*

You can try SSH Log injection (it is complicated) if you know the IP of the server then you can get shell on it.
