PentestBox is well known tool (pretty much a pentesting distro under Windows) and is very helpful when you need tools to launch an attack from a compromised computer within a network.

Bouzazi - January 27, 2018, 3:59 pm

Thanks for sharing, although it's not the "right" section.

I use this because kali linux on virtualbox lags

CyberStrike - January 28, 2018, 3:29 am

Hmm well depending on how much hardware you are dedicating to that VM it will probably lag, Kali is fairly resource heavy. Also I remember that there was some issues with Wayland and CobaltStrike, we had to run things in Xorg for a bit, Xorg works rather okay with Kali .

[This one.](#)

Plus it's already a very well known set of tools, I use it myself from time to time when I'm too lazy to boot up Linux, but it can give issues with your \$PATH environment variable.

Then you should know this thread isn't very useful, also, you can't make answers that short, it has to be at least 25 characters long.

monika1246 - *February 6, 2018, 8:52 am*

great tool but when you want to install it with Metasploit you have to disable your AV or add an exception
