Thread: [IP Sniffer like LANC with Geolocation Visual Mapping?](#)

XxUnkn0wnxX - February 1, 2018, 10:35 am

Hi, I wasn't sure where to post this but is there a piece of software like LANC or Cain and Abel (ARP Poisoning) that both grabs all ip's from a said given host and also maps them out on an actual map? so I can see who is connected to me and how many of those connections are close by to me? EG I am the point of origin and then a google map or something similar is shows all the hosts that are connected to me.

I'm doing this via my game console thats why I need something like LANC that uses ARP Poisoning to obtain the necessary connections only connected to and from my console. I need something like this to help me better understand where I am connecting or who is connected to me with visual representation. I can do this my self but it takes time. I'd prefer it, if there is something that can automate this for me.

Are you sure you're doing ARP Poisoning and not Packet Sniffing?

yes mainly packet sniffing but through hijacking id rather not physically bridge my connection from the device every time I want to do this...

I'm used to using LANC or middle man attack (ARP Spoofing/Session Hijack) where you use software which is spoofs itself to become the main gateway of the device you are infecting (router) to obtain information from targeted device.

I usually use LANC to manually get all the ips listed then I have to go 1 by 1 and Geolocate them my self but its kind of hard to do that when your in the middle of the game..

thats why I was thinking if there was something that could automate this and give me a visual map representation fo where those targets are real time..

sniffing traffic from a chosen target without doing any network bridging or proxy setups, just simple injections via ARP to temporarily hijack the traffic from my router to the chosen device to grab all the IPs but I want Geolocation mapping in real time.. (this is done within 5-10 seconds bursts and normal traffic is resumed to the device)

and yes it could be done via bridging my connection from my computer to my ps4 and sniffing through the traffic to get the ip's that way, but to much trouble I'd rather go with what I know and what is convenient and simple to use...

I am very well aware of how ARP Poisoning works.

I don't think anyone has made a software like that before, but you're very welcome to try. I guess it wouldn't be that hard, since you would only need to match IP's to locations.

I'm no programer I was never good at it. I'm a systems network admin. I know my way around a network or any computer but programming I just never understood no matter how hard I tried never got the whole concept of it. Never clicked 4 me.
