Thread: [PC started acting up, what can be wrong?](#)

**MilfMister** - February 17, 2018, 7:09 am

Hour ago, I loaded game up, during loading, whole pc froze. Had to do hard reset. While booting to windows, computer restarted on it own couple times. When I finally booted to windows, explorer.exe froze and stopped respoding for like minute. This is really unusual since I have SSD and boot time is usually under 30. sec.

Is my SSD going mad? Or maybe power supply/ram? ?

**webdev77** - February 18, 2018, 7:47 am

Is it working now? What steps have you taken to attempt to solve the problem?

**Djchipx** - February 19, 2018, 1:47 am

can you boot in Safemode? did you recently isntall any programs/Torrents/ scammy websites?

**PerfectStorm** - February 19, 2018, 1:53 am

If its your drive check with crystaldiskinfo it saved my hard drive that was failing without me knowing, just in time.

**Gt403cyl** - February 20, 2018, 2:13 pm

If you can get to safemode, do all the scans on the drives and for malicious files ect. If you need help check the whitehat section for best help.

After you are sure you have a clean system we can help diagnose hardware.

Also knowing what components you have including the powersupply is going to help.

Sounds like malware to me as well.
