Thread: [JUnit](#)

**Hepic** - February 19, 2018, 10:50 am

Hello guys ! I am trying to install junit in ubuntu and I can't. I tried this method:

[https://www.tutorialspoint.com/junit/junit\\_environment\\_setup.htm](https://www.tutorialspoint.com/junit/junit_environment_setup.htm)

Also I searched about more information in stackoverflow but found nothing.

I really don't have idea what I am doing wrong. I would appreciate if anyone could help me through teamviewer.

If anyone is interested please write a message below and I will communicate with you.

Thank you so much in advance !

Ideally, you would use some dependency management software to resolve and handle the dependencies for you. Do you use an IDE? Eclipse, for example?

If you use Eclipse, you can configure your project's build path and add an external library. This is where you include the junit jar file into your project. You can also create a lib folder in your project directory, place the dependencies in there, and add a library instead (not external).

[Take a look at this.](#)

Thank you for your response, but I do not use Eclipse. I use ubuntu, as editor I use vim and I just compile and run from terminal.

Also I am new in java and I do not know if there is any easier way than you download packages.

Ok I figured it out. I just followed this <https://github.com/junit-team/junit4/wiki/Getting-started>
