Thread: [Filling Excel sheet with data from xml file](#)

zna213 - February 23, 2018, 2:35 am

Hello guys

I have the following problem. I have an Excel sheet which has to be filled in with data from an big XML file.

At first I read in the xml file with the following code.

```
Code Sub openxXML()
```

```
Dim xml As Workbook
```

```
Dim varxml As Variant
```

```
varxml = Application.GetOpenFilename("All Files(*.*), *.*;XML-Files (*.xml),*xml*", 2, "Choose XML-File", _  
"choose", False)
```

```
If varxml = False Then
```

```
MsgBox "No Data selected"
```

```
End If
```

```
End Sub
```

But now I don't now how I can fill in my excel file, is there anybody who can give some tips or input where I can watch some tutorials or read something.

Thank u

Use a library like this one to create your XLS file: <https://github.com/JanKallman/EPPlus>

maype - February 23, 2018, 9:00 pm

Or you can simple using available library for Office excel.

See link: <http://www.c-sharpcorner.com/UploadFile/bd6c67/how-to-create-excel-file-using-C-Sharp/>

Basically you need to feed cells of the sheet. Its pretty sefl explanatory. Hope you succes.
