Thread: [Footer Bottom Of Page](#)

**Malevolent** - March 10, 2018, 12:00 am

Is there a way to make the footer load so there is no white space below it?

Example:

<https://tascware.com/blogs/forumdisplay.php?fid=2>

Thanks to anyone who can help.

I have tried about 4-5 methods so far, all with their own respective downsides.

**Bluffer** - March 10, 2018, 12:13 am

Can ya post some code? Would make things easier. The css will suffice.

**Helltoy** - March 10, 2018, 3:04 am

1.

```
Code .body {  
padding-bottom: 411px; (height of footer)  
position: relative;  
}
```

```
.footer {  
position: absolute;  
right: 0;  
left: 0;  
bottom: 0;
```

2. From [Stackoverflow](#)

Code Set html, body {height: 100%;}

Set your body (or a wrapper div) to display: table; width: 100%; height: 100%;

Set your header, footer, and content area to display: table-row;. Give your header and footer height: 1px;, and give your content area height: auto;

3. Use bootstrap

Code <https://getbootstrap.com/docs/4.0/examples/sticky-footer/>

<https://getbootstrap.com/docs/3.3/examples/sticky-footer-navbar/>

Try removing that lineWhy should I remove it? It's one of ways to make sticky footer.

**Calibur** - March 10, 2018, 7:46 am

Try this:

```
Code .container {  
min-height: calc(100vh - 518px);  
}
```

it might conflict if other parts/structure of your forum uses that class. So i suggest you to just add a new div container so you can wrap the entire BODY (header & footer ecluded) of your website except the following div:

```
.header  
.header_bg
```

.footer

You should remove it for a few different reasons.

1) Bootstrap includes a sticky-footer class you can use already so any alternative code isn't really needed.

Code .fixed-bottom .sticky-bottom

2) That isn't the way to make a 'sticky footer' that's just some random fix that makes it look fine on your screen, but probably doesn't look right to others.

Remove all margins/classes that you've added to make it stick to the bottom. Add class, 'fixed-bottom'.

1. Op currently doesn't use bootstrap(or I missed it).

I never heard for class "sticky-bottom" and can't find it in documentations. But if you make footer "fixed", footer will it be always there and goes over other content (

[https://www.w3schools.com/howto/tryit.asp?filename=tryhow\\_css\\_fixed\\_footer](https://www.w3schools.com/howto/tryit.asp?filename=tryhow_css_fixed_footer))?

2. Recommended by a lot of users (on stackoverflow) and different sites. Here is live example

<https://codepen.io/elmahdim/pen/Djlax>

Rushax - March 12, 2018, 6:14 am

Code footer{

position: absolute;

bottom: 0;

width: 100%;

left: 0;

}

Might need to have an overflow-y: hidden in there too if you're not using any frameworks.

Don't do this, it'll fuck your footer up when the content hight is > 100vh.

I'd suggest using flexbox (<https://caniuse.com/#feat=flexbox>):

```
Code body {  
  display: flex;  
  min-height: 100vh;  
  flex-direction: column;  
}
```

```
.container:first-of-type {  
  flex: 1;
```

})(you should replace '.container:first-of-type' with 'main' or a wrapper-class that'll wrap all your content).

**Tasemu** - *March 12, 2018, 7:02 am*

make sure your html and body css is set to height:100%, from there you have multiple options. If you dont care about old browser support then I recommend flexbox. Not gonna write it out for you, its easy with some google.
