Thread: [Help! Please! I want to implement hashing in my python script.](#)

lance4182 - March 12, 2018, 2:06 pm

So I was working on a python script to login to mega.co.nz. The problem is, in the post data, mega uses email and hash of email:pass.

I have done hashlib things in python before but this uses some aes algo a little complicated.

I found a site, which has a javascript doing the hashing.

[Here is the link for the site.](#)

If site was using some post request to get hash that is needed then I would have done that. But site just uses a javascript which creates hash on the go.

I tried to take that .js and used modules to be able to run it in python. but failed.

Can anyone please help me create a hash function in python that yields the required hash.

Thanks.

you can use <https://github.com/davisp/python-spidermonkey>

andmuchmore - March 12, 2018, 3:17 pm

why not use the mega sdk?

<https://github.com/meganz/sdk>

there are a couple of python examples on there as well

<https://github.com/meganz/sdk/tree/master/examples/python>

there is also a third party library which might be a little more user friendly if the sdk is overwhelming

<https://github.com/juanriaza/python-mega>

Hope this helps.

Thanks guys for the input. I will definitely look into these links after I get back home from a short vacation. SDK looks overwhelming for sure but looks promising..
