Thread: [Java Class Injector \(with Instrumentation instance; no dependencies\).](#)

Ceanko - March 14, 2018, 5:24 am

Table of Contents:

Introduction,

usage,

disclaimer,

screenshots.

Introduction: Recently, I've made a native injector that supports injecting any non-already-defined Java class. Class re-transformation is supported, but currently isn't implemented.

It gives you the ability to inject any valid (compiled) Java class file which hasn't been defined yet, into any Java Virtual Machine (JVM).

You must know how to compile Java classes, and use an injector in order to use this.

Usage: The DLL has to be injected into the JVM process of your choice. You may use any injector. All injection methods can be practiced, however I advise using LoadLibrary - the only supported, and tested injection method.

An example class that makes use of the constructed instrumentation implementation is included in the archive.

Further instructions are provided within the screenshots section.

Disclaimer: Supported platforms: Windows

Supported architectures: x64

Classes are injected via the [native system class loader](#); meaning: unless you figure out how to manage memory unsafely, you can't unload the class without some Java magic.

Instances of the original bytecode (from the class file on disk) are removed once the just in time compiler (JIT) compiles the injected class. However, an instance of the original bytecode is kept in memory by the JVM.

The DLL is packed. All detections made by anti-malware tools are false positives.

There is no protection, nor does the code ever create a socket (connect to the internet).

VirusTotal analysis: [here](#)

SHA1 (Java Injector x64.dll): A90845D2ED0551022C28DB78DD38EC918BBE24EE

Vouch for this dude, skilled in java and C Langs!

JX? - March 14, 2018, 7:49 am

Great release, glad to see you contributing Java scene.

Tojatta - March 14, 2018, 12:37 pm

Awesome, Vouch, I've heard about this coming out for a few weeks now, finally its here!

GenericSkid - March 15, 2018, 12:45 am

I find it impractical that you used green instead of pink in the console UI.

0/10

Never low quality things made by this guy (but a minecraft hack client). Awesome coder and skilled af in C++/Java ^_^

I can vouch for this project, its amazing legit..
